Abstract

The impact of ammonia toxicity in the biological leachate treatment was evaluated using biokinetic and pilot-scale membrane bioreactor. The biokinetic parameters were measured using respirometer by varying the substrate and ammonia concentration. A maximum specific growth rate of 0.42 d\textsuperscript{-1} was obtained and was found to be lower than that of the domestic wastewater (6 d\textsuperscript{-1}) indicating the difficulty in biodegradability. A bacterial inhibition of 28\% occurred at ammonium concentration of 1,000-2,000 mg l\textsuperscript{-1}, when toxicity was evaluated using respirometer. Further, when leachate was treated in membrane bioreactor, similar pattern of bacterial inhibition was observed.
